

Evidence Footage for On-Site Incidents — Checklist

backwatch.co.uk

Implementation Checklist

- ☐ The vehicle directly involved: All camera channels — not just the angle facing the incident direction. A dump truck that struck a pedestrian in the reversing zone will have the incident on the rear camera; the nearside camera may show the pedestrian's approach trajectory; the driver-facing camera may show the driver's attention state.
- ☐ Other vehicles in the operating area: Any vehicle that was within 100 metres of the incident location during the relevant time window may have camera footage showing the approach to the incident, the incident itself from a different angle, or the actions of other workers in the area.
- ☐ The period before the incident: Investigators will want footage from the hour (minimum) before the incident, not just the incident moment. The pattern of operations, the positioning of workers, the approach path of the vehicle — all are established by pre-incident footage.
- ☐ The site access and egress footage: For incidents involving vehicles arriving on or departing from site, access road or gate camera footage may establish when a vehicle arrived, in what condition, and whether any pre-incident contact or instruction was given.
